

Glazyr

Vision-first AI orchestration with safety, control, and real-world action

What Glazyr Is

Glazyr is a **vision-first AI orchestration platform** that lets intelligent agents *see, decide, and act* across real software environments — while remaining **safe, auditable, and controllable**.

Glazyr separates AI capabilities into three clear layers: - **Eyes** — local, vision-based perception (browser & UI understanding) - **Hands** — secure agent execution and tool orchestration via MCP - **Brain & Governance** — a centralized control plane for policy, safety, and oversight

This architecture enables powerful automation without sacrificing trust or compliance.

The Problem

Modern AI agents struggle to operate reliably in real environments: - Tools are siloed and brittle - UI-driven workflows require fragile scripts or RPA - Enterprises lack visibility, safety controls, and auditability - Vision-based automation raises serious privacy and security concerns

As a result, most organizations either avoid agentic automation entirely or deploy unsafe, ungoverned systems.

The Glazyr Solution

Glazyr provides **governed, vision-enabled agent orchestration** using the Model Context Protocol (MCP).

1. Vision-First Perception (Eyes)

- Chrome extension runs **locally** in the user's browser
- Uses OCR / UI understanding to convert interfaces into structured text
- No raw screenshots required by default
- Domain allowlists, local filtering, and consent-first design

2. Agent Execution & Orchestration (Hands)

- MCP-compliant runtime exposing agents as structured tools
- Built on LangChain for multi-step reasoning and tool use
- Cloud Run-deployable, horizontally scalable
- Easy integration into multi-agent systems

3. Control Plane & Safety (Brain)

- Centralized web control plane
- Configure permissions, policies, and execution boundaries
- Human-in-the-loop thresholds and emergency stop
- No chain-of-thought exposure
- Designed for auditability and enterprise governance

Why It's Different

Glazyr is not another chatbot.

Traditional Agents	Glazyr
Tool-only	Vision + tools
Centralized inference	Local-first perception
Little governance	Policy-driven control plane
Fragile automation	MCP-based orchestration

Glazyr is built for **real-world software interaction**, not just APIs.

Who It's For

- **Enterprise Operations Teams** — support, finance, compliance, research
- **Regulated Industries** — finance, healthcare, legal
- **RPA & Automation Vendors** — next-gen agent backends
- **AI Platform Builders** — MCP-native orchestration layer

Use Cases

- UI-driven workflow automation (without brittle scripts)
- Research and monitoring across complex web apps
- Human-in-the-loop task execution
- Safe deployment of autonomous agents in production environments

Architecture Snapshot

Browser Extension → Glazyr Control Plane → MCP Runtime → External Tools

Each layer is independently deployable, auditable, and replaceable.

Current Status

- MCP agent runtime deployed on Google Cloud Run
 - Control plane implemented (Next.js)
 - Chrome extension for local perception
 - Active development toward orchestration-first workflows
-

Vision

Glazyr is building the **operating system for agentic software** — where AI doesn't just talk, but *sees, reasons, and safely acts* in the real digital world.
