

Glazyr

AI Agents That **See. Verified. Production-Ready.**

The market for AI agents is expanding at an unprecedented rate.

The shift from isolated automation to intelligent, agentic AI is creating one of the largest market opportunities in software.

The compound annual growth rate approaches 50%, indicating massive commercial and investor interest.

2025 Market Size

\$5.3B - \$7.8B

2030-2033 Projection

\$42.7B - \$182.9B

CAGR

46.3% - 49.6%

Source Note: Data from AI Agent Market Forecast, Industry Report 2033, and Growth & Trends analysis.

But enterprises can't adopt agents that are brittle, blind, and unsafe.

Today's agents fail in production environments for three reasons:

1. Interface Brittleness

They rely on APIs and DOM structures that constantly change, causing frequent breaks.

2. Lack of Verification

They operate on “optimistic execution,” assuming an action succeeded without visually confirming the outcome. This leads to silent failures and hallucinated success.

3. No Architectural Safety

Safety is an afterthought, managed by prompts rather than being built into the core system. This makes them untrustworthy for critical tasks.

Most agents talk to software. Glazyr *uses* it.

Typical Agents

Glazyr

The fundamental flaw is trying to teach agents to speak “API.” Humans don’t use APIs; they see an interface and interact with it. Glazyr is built on this vision-first principle. It sees the screen, understands it visually, and acts—just like a person, but with the speed and reliability of a machine.

Our architecture separates seeing, thinking, and acting.

The Orchestrator is air-traffic control, not the pilot.

This is our core defensibility. Unlike other agents where the LLM is in control, our Orchestrator is a deterministic control system that supervises probabilistic models. It enforces rules, validates outcomes, and ensures tasks are completed safely.

Governs First

The Safety & Policy Gate checks every proposed action against user-defined rules (allowed domains, disallowed actions) *before* execution.

Executes Second

It invokes the appropriate MCP (e.g., Browser Action) with strict, non-ambiguous parameters. No natural language is used for commands.

Verifies Always

The Outcome Validator uses vision to take a new screenshot and confirm the UI changed as expected. This eliminates silent failures.

A design philosophy of "Mission Control, not the cockpit."

Our system is deliberately separated into three responsibilities to ensure auditability, safety, and scalability. This separation is non-negotiable.

Tech Stack Note
Next.js, TypeScript, AWS
Lambda, SQS, DynamoDB

The Glazyr advantage is architectural, not incremental.

	Typical AI Agents	Glazyr
Interface	APIs / DOM	Vision-first
Reliability	Optimistic (Assumes success)	Verified (Visually confirms outcomes)
Safety	Prompt-based (An afterthought)	Architectural (Built-in governance)
Extensibility	Monolith	MCP Platform (Composable)
Long-term Moat	Model access	System design

An architecture built for trust unlocks the enterprise market.

Glazyr is not just another agent; it is a governance layer for agentic AI. This focus on control, safety, and verification is what enterprises require to move beyond experiments and into production. By solving the trust problem, Glazyr is positioned to capture the highest-value segments of the agent market.

The market places a high premium on agentic AI platforms.

Recent seed-stage funding for companies in the browser-based agent and agentic framework space provides a strong benchmark for Glazyr's potential. Valuations are based on the strength of the architecture and vision, not current revenue.

Composite

Raised **\$5.6 Million**

seed for automating
browser tasks.

Browser Use

Raised **\$17 Million**

for its agentic framework.

Donut Labs

Raised **\$15 Million**

seed for an AI-powered
browser.

Median AI Startup Valuation Multiples:
20x – 30x EV/Revenue

Our superior architecture justifies a premium seed-stage valuation.

Based on the architectural clarity, “safety-first” focus, and comparable funding rounds, Glazyr is positioned to command a valuation at the high end of recent agentic framework investments.

\$15 Million to \$30 Million

Estimated Potential Seed-Stage Valuation Range

This reflects a premium for an architecture designed from first principles for enterprise-grade trust and reliability.

We are already executing on this vision.

The core components of the Glazyr stack are in active development, with key integrations already functional.

Current Status (POC)

- ✓ **End-to-End Vision:** Google Vision OCR is fully integrated, from screenshot capture in the extension to text analysis in the AWS runtime.
- ✓ **Functional Components:** The Next.js control plane, Manifest V3 Chrome Extension, and AWS serverless runtime are deployed and communicating.

90-Day Build Plan

Phase 1 (Weeks 1–4)

Complete core MCPs (Vision, Action) and extension UI.

Phase 2 (Weeks 5–8)

Build Orchestrator MVP and Memory MCP for multi-step tasks.

Phase 3 (Weeks 9–12)

Polish UI, launch marketing site, and publish developer docs.

This is not a wrapper. This is a platform.

Glazyr is the governance layer for agentic AI.

As models improve, Glazyr improves automatically. As interfaces change, Glazyr adapts visually. As new domains emerge, new MCPs can be added without rewriting the core system. We are building the calm, predictable, and safe infrastructure that will enable the agentic future.
